Received March 13, 2006

We synthesized and tested three series of bisphosphonates for their activity in inhibiting the growth of three human tumor cell lines: MCF-7 (breast), NCI-H460 (lung), and SF-268 (CNS). The first series of compounds consisted of 49 nitrogen-containing bisphosphonates, the most active species being a tetrakispivaloyloxymethyl (POM) ester, having an (average) $\mathrm{IC}_{50}$ of $6.8 \mu \mathrm{M}$. The second series of compounds consisted of nine terphenylbisphosphonates, the most active species also being a POM ester, having an $\mathrm{IC}_{50}$ of $2.2 \mu \mathrm{M}$. The third series of compounds consisted of seven halogen or cyanophenylbisphosphonates, the most active species again being a POM ester, having an $\mathrm{IC}_{50}$ of 500 nM . Taken together, these results are of interest because they show that bisphosphonate esters can have potent activity against a variety of tumor cell lines, with the most active terphenyl- and halophenyl-containing species having $\mathrm{IC}_{50}$ values $\sim 10-40 \times$ lower than the most potent commercially available bisphosphonates.

## Introduction

Nitrogen-containing bisphosphonates (NBPs) ${ }^{a}$ such as risedronate (1) and zoledronate (2) are used extensively in the treatment of osteoporosis, Paget's disease, and hypercalcemia due to malignancy. ${ }^{1,2}$ They are also potent activators of human $\gamma \delta$ T cells, ${ }^{3,4}$ as well as having in some cases direct anticancer ${ }^{5-10}$ and antiparasitic ${ }^{11-19}$ activity. They function by inhibiting the enzyme farnesyl diphosphate synthase (FPPS, EC 2.5.1.10), the enzyme responsible for the synthesis of the FPP used in protein prenylation, cholesterol, ergosterol, heme a, ubiquinone, and dolichol production. In addition, the isopentenyl diphosphate (IPP), which might accumulate on FPPS inhibition, can be converted to a "toxic ATP analog" (the isopentenyl ester of ATP) ApppI (3), which inhibits the mitochondrial adenine nucleotide translocase and is strongly pro-apoptotic. ${ }^{20}$ A second class of bisphosphonates used clinically to treat osteoporosis are the non-nitrogen-containing bisphosphonates (NNBPs), such as clodronate, etidronate, and tiludronate (4). These compounds do not inhibit FPPS, rather, they also are converted to proapoptotic ATP analogues ${ }^{21,22}$ in which the bisphosphonate condenses with AMP to form the $\beta, \gamma$-methylenetriphosphates AppCp (clodronate), AppEp (etidronate), and AppTp (5, tiludronate), which again all inhibit the mitochondrial ADP/ATP transporter and are pro-apoptotic. There are also a number of related NNBPs in development, such as the deaza-analogue of risedronate, $\mathbf{6}$, which in early work ${ }^{11}$ we found had activity against trypanosomatid parasites such as Trypanosoma brucei, the causative agent of African sleeping sickness, and Plasmodium falciparum, the causative agent of the most serious and prominent form of malaria. More recently, Lecouvey et al. ${ }^{23,24}$

[^0]reported that $\mathbf{6}$ also had activity against a human tumor cell line and was anti-angiogenic, and in their latest work, this group reported that the $p$-bromophenyl bisphosphonate 7 had an $\mathrm{IC}_{50}$ of $\sim 95 \mu \mathrm{M}$ against a human squamous cell carcinoma cell line. ${ }^{25}$

A problem with the bisphosphonates is, however, that they are poorly orally available and are rapidly adsorbed by bone. While the latter property is of course critical for their use in treating bone-related diseases, for further more general development as anticancer ${ }^{26}$ or antiparasitic agents, it might be desirable to have more lipophilic species. Plus, it would be of interest to explore the activities of a wider range of bisphosphonates, both nitrogen-containing and non-nitrogen-containing (NBPs and NNBPs), against tumor cell lines. Here, we report the synthesis

and testing against three human tumor cell lines (MCF-7, NCIH460, and SF-268) of three chemically quite distinct sets of bisphosphonates, including several which are very lipophilic.

General Synthetic Aspects. We show in Figures 1 and 2 (rank ordered in terms of decreasing activity) the structures of the 49 NBPs investigated. Most of these compounds are novel 2-(pyridinium-1-yl)ethylidene-1,1-bisphosphonates, among which those bearing a 1 -hydroxyl group ( $\mathbf{9}-\mathbf{1 1}, \mathbf{1 7}-\mathbf{1 9}, \mathbf{2 2}, 24-28$, 36, 37, 40, 43, 44, 46, and 49) were made following the protocols described previously, ${ }^{27}$ as shown in Scheme 1. Their synthesis involved the use (when necessary) of Suzuki coupling to produce a substituted pyridine, which was alkylated with bromoacetic acid, then phosphonylated with $\mathrm{H}_{3} \mathrm{PO}_{3} / \mathrm{POCl}_{3}$, as shown in Scheme 1 (top).

The other class of pyridinium-1-yl compounds are those lacking the 1-hydroxyl group (14-16, 20, 21, 29-34, 39, 41, 48, and 50-54), which were prepared by Michael addition of substituted pyridines (prepared according to Scheme 1) to vinylidene-1,1-bisphosphonic acid, as is also shown in Scheme 1 (bottom). ${ }^{28}$

The synthesis of 8, a "pro-drug" of an NBP, containing four pivaloyloxymethyl (POM) ester groups, was prepared as shown in Scheme 2. Here tetramethyl vinylidene-1,1-bisphosphonate was converted to its tetrakis-pivaloyloxymethyl ester by treat-
ment with chloromethyl pivalate and sodium iodide, ${ }^{29}$ followed by Michael addition of 2-aminopyridine, to give 8 .

We also investigated 9 NNBPs containing terphenyl side chains (55-63), shown in Figure 3. The POM ester 55 was synthesized according to Scheme 3, while the free acids (5663) of the terphenyl-containing NNBPs were synthesized basically as exemplified in Scheme 4 for the meta, metaterphenyls (56, 58, and 61).

The synthesis consists of three parts: (a) Suzuki coupling of an methyl ester of a bromophenylalkanoic acid with a biphenyl boronic acid to form a methyl terphenylalkanoate; (b) hydrolysis of the ester so obtained to yield the corresponding carboxylic acid, followed by conversion to the acid chloride; and (c) reaction of the acid chloride with tris(trimethylsilyl) phosphite, followed by hydrolysis, ${ }^{30}$ to afford the bisphosphonic acid.

Finally, we show in Figure 4 the structures of five pivaloyloxymethyl (POM) or isopropoxycarbonyloxymethyl (POC) esters ( $\mathbf{6 4 - 6 8}$ ) and two free acids ( 69 and 70) of halophenylor cyanophenyl-containing bisphosphonates (rank ordered in terms of activity, as described below). The POM esters were prepared by alkylation of tetramethyl methylenebisphosphonate with a benzyl bromide, followed by transesterification, ${ }^{29}$ as shown in Scheme 5. This strategy was then extended to form the POC esters. The free acids ( $\mathbf{6 9}$ and 70 ) were prepared by

treatment of their tetramethyl esters with bromotrimethylsilane (TMSBr), followed by hydrolysis.

Full details of the synthesis of each novel compound are described later in the paper, and microanalytical results are provided in the Supporting Information.

## Results and Discussion

We first investigated the growth inhibition of the three human tumor cell lines MCF-7 (breast), NCI-H460 (lung), and SF268 (CNS) by the nitrogen-containing bisphosphonates shown in Figures 1 and 2. The $\mathrm{IC}_{50}$ values so obtained are shown in Table 1, together with, for ease of comparison, the average $\mathrm{IC}_{50}$ values found, averaged across the three cell lines. The $\mathrm{IC}_{50}$ values for the free bisphosphonic acids (i.e., not including the POM ester, 8 ) are all in the range of $\sim 10 \mu \mathrm{M}$ to $>10 \mathrm{mM}$. Of the free acids investigated, the most active compounds are the three pyridinium-1-yl bisphosphonates $(\mathbf{9}-\mathbf{1 1})$, each containing a pyridinium-1-yl group and a hydrophobic side chain. Another
particularly active compound $\left(\mathrm{IC}_{50}(\mathrm{avg})=16.2 \mu \mathrm{M}\right)$ is the 4 -pyridyl-amino-containing bisphosphonate (12). This compound is known to be a potent FPPS inhibitor ${ }^{31}$ whose activity can be related to the presence of charge delocalization as a result of resonance with the $p$-quinonoid species (12a and 12b):

The next four most active compounds are zoledronate (2) and 13-15, all of which have average $\mathrm{IC}_{50}$ values $<30 \mu \mathrm{M}$ (Table 1), followed by risedronate (1), with an average $\mathrm{IC}_{50}$ value of $\sim 34 \mu \mathrm{M}$. All of the other free acid (or salt) compounds have $\mathrm{IC}_{50}$ values $>40 \mu \mathrm{M}$, Table 1 .

These results are all consistent with our previous pharmacophore modeling and QSAR (quantitative structure activity relationship) studies, ${ }^{4,27,31}$ which indicated the importance of having a positive charge located either in an aromatic ring or in the $\beta$-position, two negative ionizable groups, as well as a hydrophobic feature for optimal activity, and the $\mathrm{IC}_{50}$ values found are not atypical of those reported for these and other bisphosphonates in other cell lines in the literature. ${ }^{5-10}$ For example, Alvarez et al. ${ }^{32}$ found $\mathrm{IC}_{50}$ values for alendronate, risedronate (1), and pamidronate (38) of $>40,>40$, and 33.6 $\mu \mathrm{M}$, in the 13762 rat mammary carcinoma cell line. Our results do, however, suggest that obtaining $\mathrm{IC}_{50}$ values of $<10 \mu \mathrm{M}$ for the NBPs may be difficult, presumably due to their high polarity. This can be countered to some extent by adding hydrophobic

side chain features $(\mathbf{9}-\mathbf{1 1})$, but arguably, an even more pronounced effect on cell growth inhibition might be obtained by masking the bisphosphonate group by esterification. POM esters (prodrugs) of alendronate and pamidronate have been reported in the patent literature, ${ }^{33}$ however, we were not able to obtain these products in high purity.

We therefore investigated the effects of esterification of the bisphosphonate groups of another bisphosphonate, 35. This
species is a very potent, low nM inhibitor of FPPS, ${ }^{31,34}$ due we believe to its strong amidinium-like resonance stabilization

and, unlike other nitrogen-containing bisphonates, $\mathbf{3 5}$ can be

readily converted to the tetrakis-POM ester via a mild Michael addition (Scheme 2).

The parent bisphosphonate, while a potent inhibitor of FPPS, has however only a $145 \mu \mathrm{M}$ (average) $\mathrm{IC}_{50}$ value as the free acid against the three tumor cell lines, Table 1. However, on esterification, this $\mathrm{IC}_{50}$ value drops to $6.8 \mu \mathrm{M}$, Table 1, a factor of $\sim 20 \times$ improvement in potency due to masking of the highly polar bisphosphonate group. This is an interesting result because it implies that esterase activity in these tumor cell lines enables hydrolysis of the POM ester to the active free acid, opening up the possibility of developing other, even more potent, lipid soluble analogues using this approach.

The second series of bisphosphonates investigated were the nine terphenyl species shown in order of decreasing activity in Figure 3. The rationale for investigating these species in tumor cell growth inhibition was 4 -fold: First, we previously found that the simple aryl bisphosphonate $\mathbf{6}$ had activity in several cell lines and others have found activity against tumor cell lines as well, so it seemed logical to investigate modified aryl side chains to try to improve cell uptake and, perhaps, target inhibition. Second, because these compounds lack the positive charge (or basic nitrogen site) found in the NBPs, they should present less of a challenge for conversion into lipophilic (POM and POC) esters. Third, in initial work we found that addition of a single phenyl group (to make $m, p$-biphenyl ethylidene bisphosphonates) did not result in active compounds ( $\mathrm{IC}_{50}>$ $250 \mu \mathrm{M})$, necessitating incorporation of additional features: terphenyls, esters, and, as discussed below, halogen substitution. Fourth, we already had several of these compounds available in our laboratory.

Figure 3 shows the compounds investigated, and Table 2 shows the $\mathrm{IC}_{50}$ values determined. What can be seen immediately from the results presented in Table 2 is that all of the free acid NNBPs based on the terphenyl ring system are less active than are the most active free acid NBPs (Figures 1
and 2, Table 1). The most potent growth inhibitors (as the free acids) are $\mathbf{5 6}$ and $\mathbf{5 7}$, which have average $\mathrm{IC}_{50}$ values of 45.1 and $78.9 \mu \mathrm{M}$, respectively. This is clearly a factor of $\sim 3-4 \times$ weaker than with the best NBPs. The most active species have a meta substitution on the ring closest to the bisphosphonate backbone, while the two para-substituted compounds ( 62 and 63) have very low $(>480 \mu \mathrm{M})$ activity. The results shown in Table 2 indicate that a meta,meta (terphenyl, ring) substitution pattern with two side chain methylene groups results in the highest activity $(45 \mu \mathrm{M})$ and that this activity decreases on removing these groups ( $141 \mu \mathrm{M}, 1 \mathrm{CH}_{2}$ group, $58 ; 299 \mu \mathrm{M}$, no $\mathrm{CH}_{2}$ groups, 61). Compounds with para substitutions on the ring attached to the bisphosphonate group are even less active (62, $482 \mu \mathrm{M} ; \mathbf{6 3}, 622 \mu \mathrm{M}$ ). Interestingly, removal of the $1-\mathrm{OH}$ group and esterification of the phosphonate groups to form the POM ester 55 results in a major increase in activity, with 55 having an $\mathrm{IC}_{50}$ of $2.2 \mu \mathrm{M}$ (Table 2), a $60 \times$ increase in potency over the $m, m$-terphenyl analogue $58\left(\mathrm{IC}_{50}=141 \mu \mathrm{M}\right.$, Table 2$)$. While at present we cannot be certain that this effect is exclusively due to esterification (since the absence of the 1-OH group could also in principle play a role), the enhanced activity of the POM ester NNBP compares favorably with the $\sim 20 \times$ enhancement on esterification seen with the NBPs $(\mathbf{3 5} \boldsymbol{\rightarrow} \mathbf{8})$ and suggests that investigation of other terphenyl POM esters may be worthwhile.

The final series of compounds investigated were another set of NNBPs, this time containing just a single ring, but with various electron-withdrawing substituents. The rationale for investigating these compounds is that the halogen-containing bisphosphonate (4) as well as the phenyl analogue 6 have activity in cells: tiludronate (4) against osteoclasts and $\mathbf{6}$ against T. cruzi and tumor cells. Because $\mathbf{4}$ is metabolized to $\mathbf{5}$ in cells and targets the mitochondrial adenine nucleotide translocase, we reasoned that 6 (and its halogenated analogues) might also kill tumor cells in the same way and that, perhaps, halogen

substitution might result in enhanced activity (given that both tiludronate and $\mathbf{7}$ contain halogen groups). Likewise, halogenated aryl 1-amino bisphosphonates have been reported in the early literature ${ }^{35}$ as herbicides and fungicides and might also have this mechanism of action.

${ }^{a}$ Mean values over the three cell lines.
We show, therefore, in Figure 4 and Table 3 the structures and $\mathrm{IC}_{50}$ values for a series of such bisphosphonates containing electron-withdrawing groups. For the free acid/salt species ( 69 and 70), the $\mathrm{IC}_{50}$ values, not surprisingly, are very high, $>400$ $\mu \mathrm{M}$, Table 3. However, on conversion to the POM and POC esters, there are major increases in potency. Indeed, each of the five esters investigated have considerable activity against each cell line, with (average) $\mathrm{IC}_{50}$ values in the range of 500 nM to $30 \mu \mathrm{M}$, with the most active compound having the lowest $\mathrm{IC}_{50}$ value ( 500 nM ) of any of the compounds investigated in this study. There are also some clear structural trends in activity. For the POM, the activity is $3,4-\mathrm{Br}_{2} \mathrm{Ph}(64)>3,4-\mathrm{Cl}_{2} \mathrm{Ph}(65)$; the activity of the $3,4-\mathrm{Cl}_{2} \mathrm{Ph}$ POM (65) is greater than that of the $3,4-\mathrm{Cl}_{2} \mathrm{Ph} \operatorname{POC}(66)$; and the activities of each of these compounds are much greater than those of the $3,4-\mathrm{F}_{2} \mathrm{Ph}, \mathrm{CN}-$ Ph POC (67, 68), Table 3. Thus, conversion of the free acids into more lipid soluble forms appears to result in enhanced uptake into the tumor cells because, in the case of the free acids, the $\mathrm{IC}_{50}$ values are much higher (a factor of $>800$ for the most active compound, $\mathbf{6 4}$, versus its free acid, $\mathbf{6 9}$ ).

Mechanistically, based on what is known about the mode of action of the NBPs, it seems likely that many of the most active NBPs target primarily FPPS, resulting in inhibition of protein prenylation as well as production of the pro-apoptotic species ApppI (3). On the other hand, the NNBPs clodronate, etidronate, and tiludronate are thought to act by forming only toxic ATP analogues (such as $\mathbf{5}$ ), and it is possible that this mechanism also operates with species such as $\mathbf{6}, 7$, and the benzylbisphosphonates shown in Figure 4 because these compounds have essentially no inhibitory effects on FPPS (data not shown). Although we cannot rule out other possible mechanisms for these and indeed the terphenyl bisphosphonates, the observation that substitution of the bisphosphonate's methylene group by $\mathrm{Cl}_{2}, \mathrm{OH} / \mathrm{Me}$, or a chlorophenylthio group (clodronate, etidronate, tiludronate) leads in every case to incorporation of these NNBPs into AppXp analogues, clearly suggests a similar mechanism with related species (such as 64), with inhibition of the mitochondrial adenine nucleotide translocase leading to apoptosis.

However, independent of mechanism, the results presented above show that NNBPs clearly have activity against these three human tumor cell lines, with the most active compounds being considerably more potent than the most active NBPs, due, we believe at least in part, to their enhanced lipophilicity. For the NBPs 8 and 35, esterification results in a factor of 20 increase in potency ( $6.8 \mu \mathrm{M}$ versus $145 \mu \mathrm{M}$ ); in the case of the terphenyl NNBPs, esterification (combined perhaps with removal of the 1-OH group) gives a factor of $\sim 60 \times$ increase in potency, while for the dibromophenyl-containing bisphosphonate, POM ester formation results in a factor of $\sim 800 \times$ increase in activity, with $\mathrm{IC}_{50}$ values of 500 nM (64) versus $442 \mu \mathrm{M}(69)$.

Conclusions. The results we have shown above are of interest for a number of reasons. First, we have investigated the growth
inhibition behavior of 49 nitrogen-containing bisphosphonates (NBPs) against three human tumor cell lines: MCF-7 (breast), NCI-H460 (lung), and SF-268 (CNS). The $\mathrm{IC}_{50}$ values of the most potent NBPs are in the range $10-20 \mu \mathrm{M}$. However, formation of a POM ester of one NBP resulted in a decrease in $\mathrm{IC}_{50}$ from 145 to $6.8 \mu \mathrm{M}$, suggesting that related ester analogues may be worth investigating in these and other tumor cell lines. Second, we synthesized and tested a series of nine novel bisphosphonates containing the very hydrophobic, terphenyl side chain. Broadly speaking, these compounds had a similar range in activity as did the NBPs. However, the most active compound was again an ester, which was found to have an $\mathrm{IC}_{50}$ value of $2.2 \mu \mathrm{M}$. Third, we synthesized a series of bisphosphonates containing electron-withdrawing (halo, cyano) phenyl groups. The free acids had poor activity ( $>400 \mu \mathrm{M}$ ), but the POM and POC esters were much more active, with $\mathrm{IC}_{50}$ values as low as $500 \mathrm{nM},>800$ times the activity of the free acid form and likewise more active than the most active NBPs. Overall, these results are of interest because they represent the first report of the activity of a wide range of novel bisphosphonates against tumor cell growth. The $\mathrm{IC}_{50}$ values found for the NNBPs (in their ester forms) are as low as 500 nM (dibromophenyl) or 2.2 $\mu \mathrm{M}$ (terphenyl), considerably lower than the values found for the free acid NBPs in the same assays. Given the extensive literature on the effects of NBPs on tumor cell growth inhibition, further work on the lipid soluble NNBPs may be of interest, including, for example, their potential use in topical applications in vivo, as well as their activity against parasitic protozoa.

## Experimental Section

All reagents used were purchased from Aldrich (Milwaukee, WI). The purities of all compounds were routinely monitored by using ${ }^{1} \mathrm{H}$ and ${ }^{31} \mathrm{P}$ NMR spectroscopy at 400 or 500 MHz on Varian (Palo Alto, CA) Unity spectrometers using, in some instances, absolute spin-count quantitative analyses. The elemental analysis results for all new compounds are provided in the Supporting Information (Table S1).

The synthesis of $\mathbf{1 , 2}, \mathbf{1 1}-\mathbf{1 3}, \mathbf{1 7}, \mathbf{1 8}, \mathbf{2 2 - 2 7}, \mathbf{3 5}-\mathbf{3 8}, 43,45$, 47, and $\mathbf{4 8}$ have been described previously, ${ }^{11,13,16,27}$ and the samples used here were from the previous batches. The five following general methods detailed below were used to make all new compounds:

General Method A (Suzuki Coupling; Schemes 1, 3, and 4): An aryl boronic acid or its ester ( 6 mmol ), a bromo-substituted aromatic compound ( 5 mmol ), $\mathrm{K}_{2} \mathrm{CO}_{3}(15 \mathrm{mmol})$, and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ $(50 \mathrm{mg})$ in toluene $(10 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(3 \mathrm{~mL})$ were refluxed under $\mathrm{N}_{2}$ overnight. Upon extraction with diethyl ether, the product was purified by column chromatgraphy.

General Method B (Synthesis of 2-(Pyridinium-1-yl)eth-ylidene-1,1-bisphosphonic Acid): A substituted pyridine (1.2 $\mathrm{mmol})$ and vinylidene-1,1-bisphosphonic acid ${ }^{28}(1 \mathrm{mmol})$ in water $(1 \mathrm{~mL})$ was refluxed for 2 h . Upon removal of solvent, the residue was triturated with ethanol ( 3 mL ), and the resulting white suspension was filtered and washed with ethanol $(2 \times 2 \mathrm{~mL})$, affording pure 2-(pyridinium-1-yl)ethylidene-1,1-bisphosphonic acid as a white powder.

General Method C (Alkylation of Tetramethyl Methylenebisphosphonate; Schemes 3 and 5): Tetramethyl methylenebisphosphonate ( 2 mmol ) in dry DMF ( 2 mL ) was treated with NaH $(2.2 \mathrm{mmol})$ in an ice bath. A benzyl bromide ( 2 mmol ) was added to the resulting solution. The reaction mixture was stirred at room temperature for 1 h before being quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$. The product was extracted with diethyl ether and purified by column chromatography.

General Method D (Transesterification; Schemes 3 and 5): The tetramethyl ester of a bisphosphonic acid (1 mmol), NaI (4 mmol ), and chloromethyl pivalate ( 5 mmol ; or chloromethyl isopropyl carbonate, when making POC esters) were refluxed
overnight under $\mathrm{N}_{2}$ in dry acetonitrile ( 5 mL ). ${ }^{29}$ Upon removal of solvent, the residue was partitioned between water and diethyl ether, and the organic layer was washed with water and concentrated. The product was purified by using flash column chromatography (silica gel; hexane/ethyl acetate (10/1), then ethyl acetate).

General Method E (Synthesis of Terphenylbisphosphonates; Scheme 4): The methyl ester of a carboxylic acid ( 1 mmol ) was hydrolyzed with $3 \mathrm{~N} \mathrm{NaOH}(1 \mathrm{~mL})$ in methanol $(5 \mathrm{~mL})$ at room temperature for 1 h . After acidification with 2 N HCl , methanol was removed, and the resulting carboxylic acid was filtered and then washed with water. The dried acid was dissolved in benzene $(5 \mathrm{~mL})$ and oxalyl chloride ( 2 mmol ) was added, followed by one drop of DMF. The reaction mixture was then stirred for 1 h . Upon removal of solvent, the crude acid chloride so obtained was dissolved in dry THF ( 5 mL ) and $\mathrm{P}(\mathrm{OTMS})_{3}(2 \mathrm{mmol})$ was added. After 3 h at room temperature, the solvent was removed, methanol$\mathrm{H}_{2} \mathrm{O}(2 \mathrm{~mL}, 1: 1)$ was added, and the mixture was stirred for 30 min. Concentrated aqueous NaOH was then added to precipitate the target compound, which was washed thoroughly with methanol and then ether and dried to afford the bisphosphonic acids as their sodium salts.

Tetrakis-pivaloyloxymethyl 2-(Pyridin-2-ylamino)ethylidene-1,1-bisphosphonate (8). The tetrakis-pivaloyloxymethyl ester of vinylidene-1,1-bisphosphonic acid was made from tetramethyl vinylidene-1,1-bisphosphonate ( $488 \mathrm{mg}, 2 \mathrm{mmol}$ ), following General Method D but without chromatographic purification. The product was then reacted with 2-aminopyridine ( $141 \mathrm{mg}, 1.5 \mathrm{mmol}$ ) in $\mathrm{CHCl}_{3}(2 \mathrm{~mL})$ at room temperature overnight. The reaction mixture was subjected to flash chromatography (silica gel; hexane/ ethyl acetate (10/1), then ethyl acetate) to afford $8(295 \mathrm{mg}, 20 \%$ overall yield). Quantitative ${ }^{1} \mathrm{H}$ NMR indicated $95 \%$ purity. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 1.30-1.40\left(\mathrm{~m}, 36 \mathrm{H}, \mathrm{CH}_{3}\right), 2.08(\mathrm{tt}, J=$ $\left.24.4,6.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{NHCH}_{2} \mathrm{C} H\right), 3.90-4.02\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{NHCH}_{2}\right), 5.60-$ $5.70\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{O}\right), 6.47(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $6.55-$ $6.58(\mathrm{~m}, 1 \mathrm{H}$, aromatic), $7.35-7.40(\mathrm{~m}, 1 \mathrm{H}$, aromatic), 8.01 (dm, $J$ $=8.8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic). ${ }^{31} \mathrm{P}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 19.38$.

1-Hydroxy-2-[3-(4-fluorophenyl)pyridinium-1-yl]ethylidene-1,1-bisphosphonic Acid Monosodium Salt (9). Compound 9 was prepared from 3-bromopyridine ( 2 mmol ) and 4-fluorophenyl boronic acid ( 2.4 mmol ) following a published procedure ${ }^{27}$ (303 $\mathrm{mg}, 38 \%$ overall yield). Anal. $\left(\mathrm{C}_{13} \mathrm{H}_{13} \mathrm{FNNaO}_{7} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 4.90\left(\mathrm{t}, J=9.6 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right.$ ), $7.10-7.15(\mathrm{~m}$, 2 H , aromatic), $7.55-7.60(\mathrm{~m}, 2 \mathrm{H}$, aromatic), $7.80-7.85(\mathrm{~m}, 1 \mathrm{H}$, aromatic), 8.54 (d, $J=8.4 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $8.64(\mathrm{~d}, J=6.4 \mathrm{~Hz}$, 1 H , aromatic), 8.94 ( $\mathrm{s}, 1 \mathrm{H}$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $\mathrm{D}_{2} \mathrm{O}$ ): $\delta 14.06$. ${ }^{19} \mathrm{~F}$ NMR ( $\mathrm{D}_{2} \mathrm{O}$ ): $\delta-112.46$.

1-Hydroxy-2-[3-(4-trifluoromethylphenyl)pyridinium-1-yl]-ethylidene-1,1-bisphosphonic Acid Disodium Salt (10). Compound $\mathbf{1 0}$ was prepared from 3-bromopyridine ( 2 mmol ) and 4-trifluoromethylphenyl boronic acid ( 2.4 mmol ) following a published procedure ${ }^{27}$ ( $358 \mathrm{mg}, 36 \%$ overall yield). Anal. $\left(\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{~F}_{3^{-}}\right.$ $\left.\mathrm{NNa}_{2} \mathrm{O}_{7} \mathrm{P}_{2} \cdot 1.5 \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 4.93$ (t, $J=9.6 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}$ ), $7.70-7.75$ (m, 4H, aromatic), $7.90-$ $7.95(\mathrm{~m}, 1 \mathrm{H}$, aromatic), $8.63(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 8.72 (d, $J=6.4 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 9.04 (s, 1 H , aromatic). ${ }^{31} \mathrm{P}$ NMR $\left(\mathrm{D}_{2} \mathrm{O}\right): \delta 14.02 .{ }^{19} \mathrm{~F}$ NMR $\left(\mathrm{D}_{2} \mathrm{O}\right): \delta-63.14$.

2-[3-(4-Biphenyl)pyridinium-1-yl)]ethylidene-1,1-bisphosphonic Acid (14). Compound 14 was prepared from 3-(4-biphenyl)pyridine ( 1.2 mmol ), following General Method B as a white powder ( $210 \mathrm{mg}, 45 \%$ ). Anal. ( $\mathrm{C}_{19} \mathrm{H}_{19} \mathrm{NO}_{6} \mathrm{P}_{2}$ ) C, H, N. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 2.20(\mathrm{tt}, J=21,6.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 4.80-4.85$ $\left(\mathrm{m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 7.22-7.43(\mathrm{~m}, 3 \mathrm{H}$, aromatic), $7.52-7.76(\mathrm{~m}, 7 \mathrm{H}$, aromatic), $8.26-8.42(\mathrm{~m}, 1 \mathrm{H}$, aromatic), $8.67(\mathrm{~s}, 1 \mathrm{H}$, aromatic), 9.00 ( $\mathrm{m}, 1 \mathrm{H}$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 15.25$.

2-(3-Butylpyridinium-1-yl)ethylidene-1,1-bisphosphonic Acid (15). Compound 15 was prepared from 3-butylpyridine ( 1.2 mmol ) following General Method B as a white powder ( $240 \mathrm{mg}, 72 \%$ ). Anal. $\left(\mathrm{C}_{11} \mathrm{H}_{19} \mathrm{NO}_{6} \mathrm{P}_{2} \cdot 0.5 \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{D}_{2} \mathrm{O}\right): \delta 0.72\left(\mathrm{t}, J=6.5 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.10-1.15\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right)$, $1.45-1.50\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.60-2.80\left(\mathrm{~m}, 3 \mathrm{H}, \mathrm{CH}\right.$ and $\left.\mathrm{CH}_{2}\right), 4.65-$ $4.85\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{NCH}_{2}\right), 7.69(\mathrm{t}, J=6 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $8.20(\mathrm{~d}, J$
$=8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 8.50-8.60 (m, 2H, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 14.80$.

2-(3-Phenylpyridinium-1-yl)ethylidene-1,1-bisphosphonic Acid (16). Compound 16 was prepared from 3-phenylpyridine ( 1.2 mmol ) following General Method B as a white powder ( $274 \mathrm{mg}, 80 \%$ ). Anal. $\left(\mathrm{C}_{13} \mathrm{H}_{15} \mathrm{NO}_{6} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 2.48$ $(\mathrm{tt}, J=21,6.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 4.80-5.00\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{NCH}_{2}\right), 7.40-$ $7.60(\mathrm{~m}, 5 \mathrm{H}$, aromatic), $7.80-7.90(\mathrm{~m}, 1 \mathrm{H}$, aromatic $), 8.58(\mathrm{~d}, J=$ $8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $8.66(\mathrm{~d}, J=6 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 8.97 (s, 1 H , aromatic). ${ }^{31} \mathrm{P}$ NMR ( $202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 14.72$.

1-Hydroxy-2-[(3-bromoropyridinium-1-yl)]ethylidene-1,1-bisphosphonic Acid Monosodium Salt (19). Compound 19 was prepared from 3-bromopyridine $(1.2 \mathrm{mmol})$ following a published procedure ${ }^{27}(168 \mathrm{mg}, 42 \%)$. Anal. $\left(\mathrm{C}_{7} \mathrm{H}_{9} \mathrm{BrNNaO}_{7} \mathrm{P}_{2} \cdot \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H}$, N. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 4.67\left(\mathrm{t}, J=8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 7.59$ (t, $J=7 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $8.60(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 8.87 (d, $J=6 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 14.75$.

2-(3-Methylpyridinium-1-yl)ethylidene-1,1-bisphosphonic Acid (20). Compound 20 was prepared from 3-methylpyridine ( 1.2 mmol ) following General Method B as a white powder ( $230 \mathrm{mg}, 78 \%$ ). Anal. $\left(\mathrm{C}_{8} \mathrm{H}_{13} \mathrm{NO}_{6} \mathrm{P}_{2} \cdot 0.75 \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR $(400 \mathrm{MHz}$, $\left.\mathrm{D}_{2} \mathrm{O}\right): \delta 2.36\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.68(\mathrm{tt}, J=25.2,7.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH})$, $4.70-4.90\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{NCH}_{2}\right), 7.70-7.75(\mathrm{~m}, 1 \mathrm{H}$, aromatic), $8.17(\mathrm{~d}$, $J=8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $8.54(\mathrm{~d}, J=6 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 8.59 (s, 1 H , aromatic). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 14.85$.

2-(3-Ethylpyridinium-1-yl)ethylidene-1,1-bisphosphonic Acid Monosodium Salt (21). Compound 21 was prepared from 3-ethylpyridine $(1.2 \mathrm{mmol})$ following General Method B as a white powder ( 238 mg , 75\%). Anal. $\left(\mathrm{C}_{9} \mathrm{H}_{14} \mathrm{NNaO}_{6} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 1.11\left(\mathrm{t}, J=6.4 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.60-2.80(\mathrm{~m}$, $3 \mathrm{H}, \mathrm{CH}$ and $\left.\mathrm{CH}_{2}\right), 4.70-4.90\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{NCH}_{2}\right), 7.70-7.75(\mathrm{~m}, 1 \mathrm{H}$, aromatic), $8.17(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $8.54(\mathrm{~d}, J=6 \mathrm{~Hz}$, 1 H , aromatic), $8.58\left(\mathrm{~s}, 1 \mathrm{H}\right.$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 14.80$.

1-Hydroxy-2-[(3-chloropyridinium-1-yl)]ethylidene-1,1-bisphosphonic Acid (28). Compound 28 was prepared from 3-chloropyridine $(1 \mathrm{mmol})$ following a published procedure ${ }^{27}(83 \mathrm{mg}$, $25.4 \%$ ). Anal. $\left(\mathrm{C}_{7} \mathrm{H}_{10} \mathrm{ClNO}_{7} \mathrm{P}_{2} \cdot 0.5 \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR (500 $\left.\mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 4.77\left(\mathrm{t}, J=8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 7.76(\mathrm{t}, J=6 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 8.27 (d, $J=8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $8.68(\mathrm{~d}, J=6 \mathrm{~Hz}$, 1 H , aromatic). ${ }^{31} \mathrm{P}$ NMR ( $202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 15.17$.

2-(Pyridinium-1-yl)ethylidene-1,1-bisphosphonic Acid (29). Compound 29 was prepared from pyridine ( 1.2 mmol ) following General Method B as a white powder $(228 \mathrm{mg}, 85 \%)$. Anal. $\left(\mathrm{C}_{7} \mathrm{H}_{11^{-}}\right.$ $\left.\mathrm{NO}_{6} \mathrm{P}_{2} \cdot 0.25 \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 2.71$ (tt, $J=25.2,7.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 4.70-4.90\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{NCH}_{2}\right), 7.87(\mathrm{t}, J$ $=6.4 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic $), 8.37(\mathrm{t}, J=8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic $), 8.75(\mathrm{~d}$, $J=6 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 14.78$.

2-[(3-Chloropyridinium-1-yl)]ethylidene-1,1-bisphosphonic Acid (30). Compound 30 was prepared from 3-chloropyridine ( 1.2 mmol ) following General Procedure B as a white powder ( $205 \mathrm{mg}, 68 \%$ ). Anal. $\left(\mathrm{C}_{7} \mathrm{H}_{10} \mathrm{ClNO}_{6} \mathrm{P}_{2} \cdot 0.5 \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR $(500 \mathrm{MHz}$, $\left.\mathrm{D}_{2} \mathrm{O}\right): \delta 2.15(\mathrm{tt}, J=21,6.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 4.53-4.78(\mathrm{~m}, 2 \mathrm{H}$, $\left.\mathrm{CH}_{2}\right), 7.76(\mathrm{t}, J=6 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $8.30(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $8.74\left(\mathrm{~d}, J=6 \mathrm{~Hz}, 1 \mathrm{H}\right.$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( 202 MHz , $\left.\mathrm{D}_{2} \mathrm{O}\right): \delta 15.03$.

2-(3-Iodopyridinium-1-yl)ethylidene-1,1-bisphosphonic Acid (31). Compound 31 was prepared from 3-iodopyridine ( 1.2 mmol ) following General Method B as a white powder ( $284 \mathrm{mg}, 75 \%$ ). Anal. $\left(\mathrm{C}_{7} \mathrm{H}_{10} \mathrm{INO}_{6} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 2.15$ $(\mathrm{tt}, J=21,6.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 4.67-4.78\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 7.52(\mathrm{t}, J$ $=7 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic $), 8.58(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic $), 8.77(\mathrm{~d}$, $J=6 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic). ${ }^{31} \mathrm{P} \mathrm{NMR}\left(202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 15.32$.

2-(3-Bromopyridinium-1-yl)ethylidene-1,1-bisphosphonic Acid (32). Compound 32 was prepared from 3-bromopyridine ( 1.2 mmol ) following General Method B as a white powder ( $241 \mathrm{mg}, 70 \%$ ). Anal. $\left(\mathrm{C}_{7} \mathrm{H}_{10} \mathrm{BrNO}_{6} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 2.17$ $(\mathrm{tt}, J=21,6.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 4.52-4.77\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 7.53(\mathrm{t}, J$ $=7 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $8.57(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 8.77 (d, $J=6 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 14.98$.

2-[4-Benzylpyridinium-1-yl]ethylidene-1,1-bisphosphonic Acid (33). Compound 33 was prepared from 4-benzylpyridine ( 1.2 mmol ) following General Procedure B as a white powder ( $202 \mathrm{mg}, 52 \%$ ). Anal. $\left(\mathrm{C}_{14} \mathrm{H}_{16.25} \mathrm{NNa}_{0.75} \mathrm{P}_{2} \mathrm{O}_{6}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right)$ : $\delta 2.20(\mathrm{tt}, J=21,6.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 4.08\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{PhCH}_{2}\right), 4.70-$ $4.80\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}\right), 7.10-7.30(\mathrm{~m}, 5 \mathrm{H}$, aromatic), $7.61(\mathrm{~d}, J=$ $6.8 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic), $8.46\left(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 2 \mathrm{H}\right.$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 14.5$.

2-(3-Trifluoromethylpyridinium-1-yl)ethylidene-1,1-bisphosphonic Acid (34). Compound 34 was prepared from 3-trifluoromethylpyridine ( 1.2 mmol ) following General Method B as a white powder (231 mg, 69\%). Anal. $\left(\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~F}_{3} \mathrm{NO}_{6} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR (500 MHz, $\left.\mathrm{D}_{2} \mathrm{O}\right): \delta 2.84(\mathrm{tt}, J=21,6.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 4.95-$ $5.00\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 8.12(\mathrm{t}, J=6 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $8.77(\mathrm{~d}, J=$ $8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $9.07(\mathrm{~s}, 1 \mathrm{H}$, aromatic), $9.40(\mathrm{~s}, 1 \mathrm{H}$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 14.98$.

2-[3-(2-Phenylphenyl)pyridinium-1-yl]ethylidene-1,1-bisphosphonic Acid (39). Compound 39 was prepared from 3-(2phenylphenyl)pyridine $(1.2 \mathrm{mmol})$ following General Method B as a white powder ( $200 \mathrm{mg}, 48 \%$ ). Anal. $\left(\mathrm{C}_{19} \mathrm{H}_{19} \mathrm{NO}_{6} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H}, \mathrm{N}$. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 2.15(\mathrm{tt}, J=21,6.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH})$, 4.61-4.70 (m, 2H, $\mathrm{CH}_{2}$ ), 6.88-7.03 (m, 2H, aromatic), 7.06-7.16 $(\mathrm{m}, 3 \mathrm{H}$, aromatic), $7.30-7.50(\mathrm{~m}, 5 \mathrm{H}$, aromatic), $7.68-7.73(\mathrm{~m}$, 1 H , aromatic), $8.56\left(\mathrm{~s}, 1 \mathrm{H}\right.$, aromatic), $8.78\left(\mathrm{~m}, 1 \mathrm{H}\right.$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 15.31$.

1-Hydroxy-2-[(6-methylquinolinium-1-yl)]ethylidene-1,1-bisphosphonic Acid (40). Compound 40 was prepared from 6methylquinoline ( 1 mmol ) following a published procedure ${ }^{27}$ (66 mg, $19 \%$ ). Anal. $\left(\mathrm{C}_{12} \mathrm{H}_{15} \mathrm{NO}_{6} \mathrm{P}_{2} \cdot \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR (500 $\mathrm{MHz}): \delta 2.44\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 5.28\left(\mathrm{t}, J=8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 7.41-$ $7.92(\mathrm{~m}, 2 \mathrm{H}$, aromatic), $8.33(\mathrm{~s}, 1 \mathrm{H}$, aromatic), $8.70-8.90(\mathrm{~m}, 2 \mathrm{H}$, aromatic), $9.08\left(\mathrm{~d}, J=6.0 \mathrm{~Hz}, 1 \mathrm{H}\right.$, aromatic). ${ }^{31} \mathrm{P}$ NMR $(202 \mathrm{MHz}$, $\left.\mathrm{D}_{2} \mathrm{O}\right): \delta 15.15$.

2-[4-(2-Phenylphenyl)pyridinium-1-yl]ethylidene-1,1-bisphosphonic Acid (41). Compound 41 was prepared from 4-(2phenylphenyl)pyridine ( 1.2 mmol ) following General Method B as a white powder ( $187 \mathrm{mg}, 44 \%$ ). Anal. $\left(\mathrm{C}_{19} \mathrm{H}_{19} \mathrm{NO}_{6} \mathrm{P}_{2} \cdot 0.3 \mathrm{H}_{2} \mathrm{O}\right)$ C, H, N. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 2.10(\mathrm{tt}, J=21,6.5 \mathrm{~Hz}$, $1 \mathrm{H}, \mathrm{CH}), 4.61-4.70\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 6.88-7.03(\mathrm{~m}, 2 \mathrm{H}$, aromatic), $7.04-7.06(\mathrm{~m}, 2 \mathrm{H}$, aromatic), $7.06-7.21(\mathrm{~m}, 3 \mathrm{H}$, aromatic), 7.37$7.51\left(\mathrm{~m}, 4 \mathrm{H}\right.$, aromatic), $8.52\left(\mathrm{~d}, J=7 \mathrm{~Hz}, 2 \mathrm{H}\right.$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 15.31$.

1-Hydroxy-2-(7-methylquinolinium-1-yl)ethylidene-1,1-bisphosphonic Acid (42). Compound 42 was prepared from 7methylquinoline $(1 \mathrm{mmol})$ following a published procedure ${ }^{27}$ (88 $\mathrm{mg}, 24 \%$ ). Anal. $\left(\mathrm{C}_{12} \mathrm{H}_{17} \mathrm{NO}_{8} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{D}_{2} \mathrm{O}\right): \delta 2.45\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 5.31\left(\mathrm{t}, 2 \mathrm{H}, J=10 \mathrm{~Hz}, \mathrm{CH}_{2}\right), 7.64(\mathrm{~d}$, $J=8.5 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $7.74(\mathrm{t}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $8.00(\mathrm{t}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $8.30(\mathrm{~s}, 1 \mathrm{H}$, aromatic), 8.84 (d, $J=7.5 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $9.10\left(\mathrm{~d}, J=6.0 \mathrm{~Hz}, 1 \mathrm{H}\right.$, aromatic). ${ }^{31} \mathrm{P}$ NMR (202 MHz, $\mathrm{D}_{2} \mathrm{O}$ ): $\delta 15.15$.

1-Hydroxy-2-(4-phenylpyridinium-1-yl)ethylidene-1,1-bisphosphonic Acid (44). Compound 44 was prepared from 4-phenylpyridine ( 1 mmol ) following a published procedure ${ }^{27}(158 \mathrm{mg}, 41 \%$ overall yield). Anal. $\left(\mathrm{C}_{13} \mathrm{H}_{18} \mathrm{NO}_{7} \mathrm{P}_{2} \cdot 1.5 \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 4.70-4.85\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}\right), 7.10-7.30(\mathrm{~m}, 5 \mathrm{H}$, aromatic), $7.71(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic), $8.50(\mathrm{~d}, J=6.8 \mathrm{~Hz}$, 2 H , aromatic). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{D} 2 \mathrm{O}$ ): $\delta 14.7$.

1-Hydroxy-2-(4-methoxypyridinium-1-yl)ethylidene-1,1-bisphosphonic Acid (46). Compound 46 was prepared from 4-methoxypyridine ( 1 mmol ) following a published procedure ${ }^{27}$ ( 88 mg , $28 \%$ ). Anal. $\left(\mathrm{C}_{8} \mathrm{H}_{13} \mathrm{NO}_{8} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR ( 500 MHz ): $\delta 3.94$ $(\mathrm{s}, 3 \mathrm{H}, \mathrm{OMe}), 5.22\left(\mathrm{t}, J=10 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 7.22(\mathrm{~d}, J=6 \mathrm{~Hz}$, 2 H , aromatic), 8.44 (d, $J=6 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic). ${ }^{31} \mathrm{P}$ NMR (202 $\left.\mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 15.15$.

1-Hydroxy-2-[4-(pyridine-4-yl)pyridinium-1-yl)ethylidene-1,1bisphosphonic Acid Disodium Salt (49). Compound 49 was prepared from 4,4'-bipyridyl ( 1 mmol ) following a published procedure ${ }^{27}$ (113 mg, 25\%). Anal. $\left(\mathrm{C}_{12} \mathrm{H}_{13} \mathrm{~N}_{2} \mathrm{Na}_{2} \mathrm{O}_{7} \mathrm{P}_{2} \cdot 2.5 \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}$, $\mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 4.93\left(\mathrm{t}, J=10 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right)$, $8.27(\mathrm{~d}, J=6.5 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic), $8.36(\mathrm{~d}, J=6.5 \mathrm{~Hz}, 2 \mathrm{H}$,
aromatic), $8.85(\mathrm{~d}, J=6.5 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic), $8.94(\mathrm{~d}, J=6.5 \mathrm{~Hz}$, 2 H , aromatic). ${ }^{31} \mathrm{P}$ NMR ( $202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 13.68$.

2-(Isoquinolinium-2-yl)ethylidene-1,1-bisphosphonic Acid (50). Compound $\mathbf{5 0}$ was prepared from isoquinoline ( 1.2 mmol ) following General Method B as a white powder ( 262 mg , $82 \%$ ). Anal. $\left(\mathrm{C}_{11} \mathrm{H}_{14}{ }^{-}\right.$ $\left.\mathrm{NO}_{6} \mathrm{P}_{2} \cdot 0.5 \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 2.79(\mathrm{tt}, J$ $=21,6.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 4.80-5.00\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{NCH}_{2}\right), 7.80-8.40(\mathrm{~m}$, 6 H , aromatic), $9.61\left(\mathrm{~s}, 1 \mathrm{H}\right.$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 15.01$.

2-(4-Trifluoromethylpyridinium-1-yl)ethylidene-1,1-bisphosphonic Acid (51). Compound 51 was prepared from 4-trifluoromethylpyridine ( 1.2 mmol ) following General Method B as a white powder ( $213 \mathrm{mg}, 62 \%$ ). Anal. $\left(\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~F}_{3} \mathrm{NO}_{6} \mathrm{P}_{2} \cdot 0.5 \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H}, \mathrm{N}$. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 2.17(\mathrm{tt}, J=21,6.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH})$, $4.94-5.01\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 8.27(\mathrm{~d}, J=6.5 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic), 9.10 (d, $J=6.5 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 14.75$.

2-[3-(Pyrollidin-1-ylsulfonyl)pyridinium-1-yl]ethylidene-1,1bisphosphonic Acid (52). Compound 52 was prepared from 3-(pyrollidin-1-ylsulfonyl)pyridine ${ }^{36}(1.2 \mathrm{mmol})$ following General Method B as a white powder (270 mg, 66\%). Anal. $\left(\mathrm{C}_{11} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{8} \mathrm{P}_{2} \mathrm{~S} \cdot\right.$ $\left.0.5 \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR ( 500 MHz ): $\delta 1.60-1.65(\mathrm{~m}, 4 \mathrm{H}$, $\left.2 \mathrm{CH}_{2}\right), 2.73(\mathrm{tt}, J=21,6.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 3.10-3.20\left(\mathrm{~m}, 4 \mathrm{H}, 2 \mathrm{CH}_{2^{-}}\right.$ NS), 4.94-5.01 (m, 2H, $\left.\mathrm{NCH}_{2}\right), 8.10-8.15(\mathrm{~m}, 1 \mathrm{H}$, aromatic), 8.80 (d, $J=6.5 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $9.06(\mathrm{~d}, J=6.5 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 9.43 (s, 1H, aromatic). ${ }^{31} \mathrm{P}$ NMR (202 MHz, $\left.\mathrm{D}_{2} \mathrm{O}\right): \delta 14.19$.

2-[4-(4-Phenylphenyl)pyridinium-1-yl)]ethylidene-1,1-bisphosphonic Acid (53). Compound 53 was prepared from 4-(4phenylphenyl)pyridine ( 1.2 mmol ) following General Method B as a white powder ( $222 \mathrm{mg}, 53 \%$ ). Anal. $\left(\mathrm{C}_{19} \mathrm{H}_{19} \mathrm{NO}_{6} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H}, \mathrm{N}$. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 2.19(\mathrm{tt}, J=21,6.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH})$, $4.51-4.60\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 7.31(\mathrm{t}, J=6 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic $), 7.38(\mathrm{t}$, $J=6 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic), $7.57(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic), 7.66 (d, $J=8.5 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic), $7.80(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic), $8.00(\mathrm{~d}, J=7 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic), $8.68(\mathrm{~d}, J=7 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic $)$. ${ }^{31} \mathrm{P}$ NMR ( $202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 15.31$.

2-[4-(3-Phenylphenyl)pyridinium-1-yl)]ethylidene-1,1-bisphosphonic Acid Monosodium Salt (54). Compound 54 was prepared from 4-(3-phenylphenyl)pyridine ( 1.2 mmol ) following General Method B as a white powder (306 mg, 68\%). Anal. $\left(\mathrm{C}_{19} \mathrm{H}_{18} \mathrm{NO}_{6} \mathrm{P}_{2^{-}}\right.$ $\left.\mathrm{Na} \cdot 0.5 \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 2.19(\mathrm{tt}, J=$ $21,6.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}), 4.49-4.61\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 7.26(\mathrm{t}, J=15 \mathrm{~Hz}$, 2 H , aromatic), 7.32 ( $\mathrm{t}, J=15 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic), $7.47(\mathrm{~d}, J=7.5$ $\mathrm{Hz}, 2 \mathrm{H}$, aromatic), $7.66(\mathrm{~m}, 2 \mathrm{H}$, aromatic), $7.80(\mathrm{~s}, 1 \mathrm{H}$, aromatic), $7.95(\mathrm{~d}, J=7 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic), $8.68(\mathrm{~d}, J=7 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $202 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 15.24$.

Tetrakis-pivaloyloxymethyl 2-[3-(3-Phenylphenyl)phenyl]eth-ylidene-1,1-bisphosphonate (55). 3-Biphenyl boronic acid ( 2.0 g , $10 \mathrm{mmol})$, 3-bromotoluene $(1.7 \mathrm{~g}, 10 \mathrm{mmol}), \mathrm{K}_{2} \mathrm{CO}_{3}(3.0 \mathrm{~g}, 21.7$ $\mathrm{mmol})$, and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(100 \mathrm{mg})$ were refluxed in toluene $-\mathrm{H}_{2} \mathrm{O}$ ( $50 \mathrm{~mL}, 5 / 1$ ) overnight under $\mathrm{N}_{2}$. Upon extraction with diethyl ether, the crude product was then refluxed overnight with N -bromosuccimide ( $1.95 \mathrm{~g}, 11 \mathrm{mmol}$ ) and $\operatorname{AIBN}(100 \mathrm{mg})$ in anhydrous $\mathrm{CCl}_{4}$ $(30 \mathrm{~mL})$. After washing successively with $5 \% \mathrm{HCl}$ then $10 \%$ $\mathrm{NaHCO}_{3}$, the organic layer was dried and concentrated to give crude 3-(3-phenylphenyl)benzyl bromide as a white powder. This was then reacted following General Method C, followed by General Method D, affording compound 55 as a pale yellow powder (472 $\mathrm{mg}, 27 \%$ overall yield). Quantative ${ }^{1} \mathrm{H}$ NMR indicated $94 \%$ purity. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 1.2-1.30\left(\mathrm{~m}, 36 \mathrm{H}, \mathrm{CH}_{3}\right), 2.80(\mathrm{tt}$, $\left.J=24.8,6.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArCH}_{2} \mathrm{CH}\right), 3.15(\mathrm{td}, J=17.2,6.8 \mathrm{~Hz}, 2 \mathrm{H}$, $\left.\mathrm{ArCH}_{2}\right), 5.62-5.69\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{POCH}_{2}\right), 7.23-7.85(\mathrm{~m}, 13 \mathrm{H}$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl} 3$ ): $\delta 20.52$.

1-Hydroxy-3-[3-(3-phenylphenyl)phenyl]propylidene-1,1-bisphosphonic Acid Trisodium Salt (56). Compound 56 was prepared from methyl 3-(3-phenylphenyl)phenylpropionate ( 1 mmol ) following General Method E as a white powder ( $324 \mathrm{mg}, 61 \%$ ). Anal. $\left(\mathrm{C}_{21} \mathrm{H}_{19} \mathrm{O}_{7} \mathrm{P}_{2} \mathrm{Na}_{3} \cdot \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H} .{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{~Hz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 2.01-$ $2.12\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.80-2.85\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{ArCH}_{2}\right), 7.23-7.57(\mathrm{~m}$, 12 H , aromatic), 7.77 (s, 1 H , aromatic). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{~Hz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 19.41$.

1-Hydroxy-2-[3-(2-phenylphenyl)phenyl]ethylidene-1,1-bisphosphonic Acid Disodium Salt (57). Compound 57 was prepared from methyl 3-(2-phenylphenyl)phenylacetate ( 1 mmol ) following General Method E as a white powder ( $213 \mathrm{mg}, 43 \%$ ). Anal. $\left(\mathrm{C}_{20} \mathrm{H}_{18} \mathrm{O}_{7} \mathrm{P}_{2} \mathrm{Na}_{2} \cdot \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 3.10(\mathrm{t}$, $\left.J=12 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 6.73-7.40\left(\mathrm{~m}, 13 \mathrm{H}\right.$, aromatic). ${ }^{31} \mathrm{P}$ NMR $\left(162 \mathrm{~Hz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 19.23$.

1-Hydroxy-2-[3-(3-phenylphenyl)phenyl]ethylidene-1,1-bisphosphonic Acid Monosodium Salt (58). Compound 58 was prepared from methyl 3-(3-phenylphenyl)phenylacetate ( 1 mmol ) following General Method E as a white powder ( $265 \mathrm{mg}, 56 \%$ ). Anal. $\left(\mathrm{C}_{20} \mathrm{H}_{19} \mathrm{NaO}_{7} \mathrm{P}_{2} \cdot \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H} .{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta$ $3.23\left(\mathrm{t}, J=12 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 7.20-7.80\left(\mathrm{~m}, 13 \mathrm{H}\right.$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{~Hz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 19.20$.

1-Hydroxy-3-[3-(2-phenylphenyl)phenyl]propylidene-1,1-bisphosphonic Acid Trisodium Salt (59). Compound 59 was prepared from methyl 3-(2-phenylphenyl)phenylpropionate ( 1 mmol ) following General Method E as a white powder ( $271 \mathrm{mg}, 51 \%$ ). Anal. $\left(\mathrm{C}_{21} \mathrm{H}_{19} \mathrm{O}_{7} \mathrm{P}_{2} \mathrm{Na}_{3} \cdot \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H} .{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 1.98-$ $2.10\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.69-2.72\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{ArCH}_{2}\right), 6.70(\mathrm{~d}, J=6.5$ $\mathrm{Hz}, 1 \mathrm{H}$, aromatic), $6.97(\mathrm{t}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 7.04-7.17 (m, 7H, aromatic), 7.32-7.45 (m, 4H, aromatic). ${ }^{31} \mathrm{P}$ NMR (202 $\left.\mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 19.38$.

1-Hydroxy-3-[3-(4-phenylphenyl)phenyl]propylidene-1,1-bisphosphonic Acid Disodium Salt (60). Compound 60 was prepared from methyl 3-(4-phenylphenyl)phenylpropionate ( 1 mmol ) following General Method E as a white powder ( $270 \mathrm{mg}, 55 \%$ ). Anal. $\left(\mathrm{C}_{21} \mathrm{H}_{20} \mathrm{O}_{7} \mathrm{P}_{2} \mathrm{Na}_{2}\right) \mathrm{C}, \mathrm{H} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 2.05-2.10$ $\left(\mathrm{m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.80-2.85\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{ArCH}_{2}\right), 7.22-7.32(\mathrm{~m}, 6 \mathrm{H}$, aromatic), $7.35-7.64\left(\mathrm{~m}, 7 \mathrm{H}\right.$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( 162 MHz , $\left.\mathrm{D}_{2} \mathrm{O}\right): \delta 19.08$.

1-Hydroxy-[3-(3-phenylphenyl)phenyl]methylene-1,1-bisphosphonic Acid Monosodium Salt (61). Compound 61 was prepared from methyl 3-(3-phenylphenyl)benzoate ( 1 mmol ) following General Method E as a white powder ( $174 \mathrm{mg}, 40 \%$ ). Anal. $\left(\mathrm{C}_{19} \mathrm{H}_{17} \mathrm{O}_{7} \mathrm{P}_{2} \mathrm{Na} \cdot 0.25 \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}$, H. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta$ $7.17-7.25\left(\mathrm{~m}, 2 \mathrm{H}\right.$, aromatic), $7.33\left(\mathrm{t}, J_{\mathrm{H}-\mathrm{H}}=7.2 \mathrm{~Hz}, 2 \mathrm{H}\right.$, aromatic), $7.40(\mathrm{t}, J=8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $7.47(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $7.56-7.58(\mathrm{~m}, 4 \mathrm{H}$, aromatic), $7.65(\mathrm{~d}, J=8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 7.83 (s, 2H, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 17.59$.

1-Hydroxy-2-[4-(3-phenylphenyl)phenyl]ethylidene-1,1-bisphosphonic Acid Monosodium Salt (62). Compound 62 was prepared from methyl 4-(3-phenylphenyl)phenylacetate ( 1 mmol ) following General Method E as a white powder (201 mg, 44\%). Anal. $\left(\mathrm{C}_{20} \mathrm{H}_{19} \mathrm{O}_{7} \mathrm{P}_{2} \mathrm{Na}\right) \mathrm{C}, \mathrm{H} .{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 3.21$ (t, $J=12.4 \mathrm{~Hz}, \mathrm{CH}_{2}$ ), $7.27(\mathrm{t}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $7.34-7.60$ (m, 11H, aromatic), $7.80\left(\mathrm{~s}, 1 \mathrm{H}\right.$, aromatic). ${ }^{31} \mathrm{P}$ NMR $(162 \mathrm{MHz}$, $\left.\mathrm{D}_{2} \mathrm{O}\right): \delta 19.11$.

1-Hydroxy-2-[4-(2-phenylphenyl)phenyl]ethylidene-1,1-bisphosphonic Acid Disodium Salt (63). Compound 63 was prepared from methyl 4-(2-phenylphenyl)phenylacetate ( 1 mmol ) following General Method E as a white powder ( $232 \mathrm{mg}, 45 \%$ ). Anal. $\left(\mathrm{C}_{20} \mathrm{H}_{18} \mathrm{O}_{7} \mathrm{P}_{2} \mathrm{Na}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta 3.06$ $\left(\mathrm{t}, J=12.4 \mathrm{~Hz}, \mathrm{CH}_{2}\right), 6.94(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}$, aromatic), 7.01$7.07(\mathrm{~m}, 2 \mathrm{H}$, aromatic), 7.11-7.17 (m, 4H, aromatic), 7.30-7.39 $\left(\mathrm{m}, 5 \mathrm{H}\right.$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 18.97$.

Tetrakis-pivaloyloxymethyl 2-(3,4-dibromophenyl)ethylidene-1,1-bisphosphonate (64). Compound 64 was prepared from 3,4dibromobenzyl bromide ( 1 mmol ) following General Method C, followed by General Method D, as a pale yellow powder $(159 \mathrm{mg}$, $18 \%$ overall yield). Anal. $\left(\mathrm{C}_{32} \mathrm{H}_{50} \mathrm{Br}_{2} \mathrm{O}_{14} \mathrm{P}_{2}\right) \mathrm{C}$, H. ${ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 1.20-1.30\left(\mathrm{~m}, 36 \mathrm{H}, \mathrm{CH}_{3}\right), 2.79(\mathrm{tt}, J=24.8,6.8$ $\mathrm{Hz}, 1 \mathrm{H}, \mathrm{ArCH}_{2} \mathrm{CH}$ ), 3.08 (td, $J=17.2,6.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArCH}_{2}$ ), $5.62-$ $5.69\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{POCH}_{2}\right), 7.10(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic $), 7.43(\mathrm{~d}$, $J=8.4 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 7.56 (s, 1 H , aromatic). ${ }^{31} \mathrm{P}$ NMR (162 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 20.35$.

Tetrakis-pivaloyloxymethyl 2-(3,4-dichlorophenyl)ethylidene-1,1-bisphosphonate (65). Compound 65 was prepared from 3,4dichlorobenzyl bromide ( 1 mmol ) following General Method C, followed by General Method D, as a pale yellow powder $(153 \mathrm{mg}$, $21 \%$ ). Anal. $\left(\mathrm{C}_{32} \mathrm{H}_{50} \mathrm{Cl}_{2} \mathrm{O}_{14} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H} .{ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ :
$\delta 1.20-1.30\left(\mathrm{~m}, 36 \mathrm{H}, \mathrm{CH}_{3}\right), 2.80(\mathrm{tt}, J=24.8,6.8 \mathrm{~Hz}, 1 \mathrm{H}$, $\left.\mathrm{ArCH}_{2} \mathrm{CH}\right), 3.15\left(\mathrm{td}, J=17.2,6.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArCH}_{2}\right), 5.62-5.69$ $\left(\mathrm{m}, 8 \mathrm{H}, \mathrm{POCH}_{2}\right), 7.10(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 7.33-7.35 ( $\mathrm{m}, 2 \mathrm{H}$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 20.41$.

Tetrakis-isopropoxycarbonyloxymethyl 2-(3,4-dichlorophen-yl)ethylidene-1,1-bisphosphonate (66). Compound 66 was prepared from 3,4-dichlorobenzyl bromide ( 1 mmol ) following General Method C, followed by General Method D, as a pale yellow powder (136 mg, 17\%). Anal. $\left(\mathrm{C}_{28} \mathrm{H}_{42} \mathrm{Cl}_{2} \mathrm{O}_{18} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H} .{ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\mathrm{CDCl}_{3}$ ): $\delta 1.32\left(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 24 \mathrm{H}, \mathrm{CH}_{3}\right), 2.75(\mathrm{tt}, J=24.4,6.4$ $\left.\mathrm{Hz}, 1 \mathrm{H}, \mathrm{ArCH}_{2} \mathrm{CH}\right), 3.47\left(\mathrm{td}, J=17.2,6.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArCH}_{2}\right), 4.89-$ $4.95\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CHMe}_{2}\right), 5.60-5.70\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{O}\right), 7.13(\mathrm{~d}, J=$ $6.8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $7.35(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $7.38(\mathrm{~s}$, 1 H , aromatic). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 21.85$.

Tetrakis-isopropoxycarbonyloxymethyl 2-(3,4-difluorophen-yl)ethylidene-1,1-bisphosphonate (67). Compound 67 was prepared from 3,4-difluorobenzyl bromide ( 1 mmol ) following General Method C, followed by General Method D, as a pale yellow powder ( $107 \mathrm{mg}, 14 \%$ ). Anal. $\left(\mathrm{C}_{28} \mathrm{H}_{42} \mathrm{~F}_{2} \mathrm{O}_{18} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H} .{ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta 1.33\left(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 24 \mathrm{H}, \mathrm{CH}_{3}\right), 2.88(\mathrm{tt}, J=24.4, J=$ $\left.6.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArCH}_{2} \mathrm{CH}\right), 3.40\left(\mathrm{td}, J=17.2,6.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArCH}_{2}\right.$ ), 4.89-4.95 (m, 4H, CHMe 2 ), $5.60-5.72\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{O}\right), 6.99-$ 7.13 (m, 3H, aromatic). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 21.94$. ${ }^{19} \mathrm{~F}$ NMR (376 MHz, $\mathrm{CDCl}_{3}$ ): $-140.79 \sim-140.67$ (m, 1F), -138.08~-137.97 (m, 1F).

Tetrakis-isopropoxycarbonyloxymethyl 2-(3-cyanophenyl)-ethylidene-1,1-bisphosphonate (68). Compound 68 was prepared from 3-cyanobenzyl bromide ( 1 mmol ) following General Method C, followed by General Method D, as a pale yellow powder (91 $\mathrm{mg}, 12 \%)$. Anal. $\left(\mathrm{C}_{29} \mathrm{H}_{43} \mathrm{NO}_{18} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta 1.31\left(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 24 \mathrm{H}, \mathrm{CH}_{3}\right), 2.79(\mathrm{tt}, J=20.8, J=$ $6.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArCH}_{2} \mathrm{CH}$ ), 3.40 (td, $J=16.8,6.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArCH}_{2}$ ), 4.89-4.96 (m, 4H, CHMe 2 ), 5.60-5.70 (m, 8H, OCH2 $\mathrm{OH}_{2}$ ), 7.36 (t, $J=8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $7.50-7.54(\mathrm{~m}, 2 \mathrm{H}$, aromatic), $7.57(\mathrm{~s}$, 1 H , aromatic). ${ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 21.70$.

2-(3,4-Dibromophenyl)ethylidene-1,1-bisphosphonic Acid (69). Compound 69 was prepared from 3,4-dibromobenzyl bromide (1 mmol ) following General Method C, followed by hydrolysis with bromotrimethylsilane, as a white powder $(275 \mathrm{mg}, 65 \%$ overall yield). Anal. $\left(\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{Br}_{2} \mathrm{O}_{6} \mathrm{P}_{2}\right) \mathrm{C}, \mathrm{H} .{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta$ 2.78 (tt, $\left.J=20.8,6.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArCH}_{2} \mathrm{CH}\right), 3.12(\mathrm{td}, J=17.2,6.8$ $\left.\mathrm{Hz}, 2 \mathrm{H}, \mathrm{ArCH}_{2}\right), 7.10(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 7.43 (d, $J=$ $8.4 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), $7.56\left(\mathrm{~s}, 1 \mathrm{H}\right.$, aromatic). ${ }^{31} \mathrm{P}$ NMR ( 162 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta 19.87$.

2-(3-Cyanophenyl)ethylidene-1,1-bisphosphonic Acid Trisodium Salt (70). Compound 70 was prepared from 3-cyanobenzyl bromide ( 1 mmol ) following General Method C, followed by hydrolysis with bromotrimethylsilane, as a white powder (29\%). Anal. $\left(\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{NNa}_{3} \mathrm{O}_{6} \mathrm{P}_{2} \cdot \mathrm{H}_{2} \mathrm{O}\right) \mathrm{C}, \mathrm{H}, \mathrm{N} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ): $\delta 2.79\left(\mathrm{tt}, J=20.8,6.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{ArCH}_{2} \mathrm{CH}\right), 3.40(\mathrm{td}, J=16.8$, $6.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{ArCH}_{2}$ ), 4.89-4.96 (m, 4H, CHMe 2 ), $5.60-5.70(\mathrm{~m}$, $\left.8 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{O}\right), 7.39(\mathrm{t}, J=8 \mathrm{~Hz}, 1 \mathrm{H}$, aromatic), 7.45-7.52(m,2H, aromatic), 7.59 ( $\mathrm{s}, 1 \mathrm{H}$, aromatic). ${ }^{31} \mathrm{P} \mathrm{NMR}\left(162 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right): \delta$ 19.81.

Cell Growth Inhibition Assays. The human tumor cell lines MCF-7 (breast adenocarcinoma), NCI-H460 (lung large cell), and SF-268 (central nervous system glioblastoma) were obtained from the National Cancer Institute. All lines were cultured in RPMI1640 medium supplemented with $10 \%$ fetal bovine serum and 2 mM L-glutamine at $37^{\circ} \mathrm{C}$ in a $5 \% \mathrm{CO}_{2}$ atmosphere with $100 \%$ humidity. A broth microdilution method was used to determine $\mathrm{IC}_{50}$ values for growth inhibition by each bisphosphonate. Cells were inoculated at a density of 5000 cells/well into 96 -well flat bottom culture plates containing $10 \mu \mathrm{~L}$ of the test compound, previously half-log serial diluted (from 0.316 mM to 0.1 pM ), for a final volume of $100 \mu \mathrm{~L}$. NBPs were typically initially dissolved in $\mathrm{H}_{2} \mathrm{O}$ ( 0.01 M ), while NNBPs were typically dissolved in DMSO (0.01 M). Plates were then incubated for 4 days at $37{ }^{\circ} \mathrm{C}$ in a $5 \% \mathrm{CO}_{2}$ atmosphere at $100 \%$ humidity after which an MTT ((3-(4,5-dimethylthiazole-2-yl)-2,5-diphenyltetrazolium bromide) cell proliferation assay (ATCC, Manassas, VA) ${ }^{37}$ was used to obtain dose-
response curves. The DMSO carrier had no effect on cell proliferation. GraphPad PRISM version 4.0 software for windows (GraphPad Software, Inc., San Diego, CA, www.graphpad.com) was used to fit the data to a rectangular hyperbolic function:

$$
I=\frac{I_{\max } C}{\mathrm{IC}_{50}+C}
$$

where $I$ is the percent inhibition, $I_{\max }=100 \%$ inhibition, $C$ is the concentration of the inhibitor, and $\mathrm{IC}_{50}$ is the concentration for $50 \%$ growth inhibition. Typical dose-response curves for 2 NBPs, 2 terphenyl, and 2 halophenyl NBPs are shown in the Supporting Information (Figure S1).
